Chronoverse

Installation Guide

Everything you need to add Chronoverse to a Flutter project on macOS or Windows, verify it, and keep it up to date.

Version 0.1.0 · October 2026

Developed by Sanket Santosh Vidya Manohar

1 About Chronoverse

Chronoverse is an all-in-one calendar and date toolkit for Flutter. A single package gives you month, week, year, schedule, agenda and planner views; single, multiple and range pickers; typed date input; recurrence; time zones; calendar conversions; and more than 80 ready-made date and time functions.

Zero dependencies

Chronoverse depends only on the Flutter SDK. It cannot cause version conflicts with other packages in your project.

No setup

No initialization call, no platform configuration, no permissions and no localization delegates are required.

Every platform

Android, iOS, web, macOS, Windows and Linux, from one code base.

Two entry points

`chronoverse.dart` for widgets and functions; `core.dart` for pure Dart functions without any UI.

Chronoverse
Developed by Sanket Santosh Vidya Manohar

2 Requirements

Item	Minimum	Notes
Flutter SDK	3.24.0	Stable channel recommended.
Dart SDK	3.5.0	Included with Flutter.
Development OS	macOS 12 or Windows 10 (64-bit)	Linux is also supported.
Disk space	about 3 MB	For the package itself.
Internet	Only to download	The package never connects to the network at run time.

Check your installed versions in a terminal:

```
flutter --version
dart --version
```

> If your Flutter SDK is older than 3.24.0, run `flutter upgrade` before continuing.

3 Preparing a macOS machine

Skip this section if Flutter already runs on your Mac (`flutter doctor` shows no errors for the platforms you build for).

1. **Download the Flutter SDK** for macOS from the official Flutter website. Choose the build that matches your processor (ARM or x64).
2. **Extract it** to a folder without spaces, for example `~/development/flutter`.
3. **Add Flutter to your PATH.** Open the Terminal app and run:

```
echo 'export PATH="$HOME/development/flutter/bin:$PATH"' >> ~/.zshrc
source ~/.zshrc
```

4. **Install the platform build tools** for the targets you need: the official iOS/macOS developer tools from the Mac App Store for iOS and macOS apps, and the Android SDK for Android apps.
5. **Run the doctor** and fix anything it reports:

```
flutter doctor
```

6. **Enable desktop and web targets** if you want them:

```
flutter config --enable-macos-desktop
flutter config --enable-web
```

> Chronoverse contains no native code, so it needs nothing extra on macOS: no pod files, entitlements or Info.plist keys.

4 Preparing a Windows machine

Skip this section if Flutter already runs on your PC.

1. **Download the Flutter SDK** for Windows from the official Flutter website.
2. **Extract it** to a folder without spaces or special permissions, for example `C:\src\flutter`. Avoid `C:\Program Files\`.
3. **Add Flutter to your PATH.** Open *Start → Edit environment variables for your account*, select `Path`, choose *Edit → New* and add `C:\src\flutter\bin`. Close and reopen any terminal.
4. **Turn on Developer Mode** (*Settings → Privacy & security → For developers*). Flutter needs it to create symbolic links when building.
5. **Install the platform build tools** for the targets you need: the C++ desktop build tools for Windows apps, and the Android SDK for Android apps.
6. **Run the doctor** from a Command Prompt or terminal and fix anything it reports:

```
flutter doctor
```

7. **Enable desktop and web targets** if you want them:

```
flutter config --enable-windows-desktop
flutter config --enable-web
```

> Chronoverse uses only Dart and Flutter code, so Windows needs no extra libraries, DLLs or registry settings. File endings are normalised in the package, so it behaves the same whether your editor uses Windows or Unix line endings.

5 Adding Chronoverse to your app

Option A: command line (recommended)

From the root folder of your Flutter project (the folder containing `pubspec.yaml`), run:

```
flutter pub add chronoverse
```

This adds the latest version to `pubspec.yaml` and downloads it. The same command works in the macOS Terminal, the Windows Command Prompt and any editor's built-in terminal.

Option B: edit pubspec.yaml

```
dependencies:
  flutter:
    sdk: flutter
  chronoverse: ^0.1.0
```

Save the file, then run:

```
flutter pub get
```

Import it

```
// Widgets and every function:
import 'package:chronoverse/chronoverse.dart';

// Pure Dart functions only (servers, command-line tools, isolates):
import 'package:chronoverse/core.dart';
```

> You do not need to add anything to `MaterialApp`. Languages, themes and time zones work out of the box.

6 Verifying the installation

Replace the contents of `lib/main.dart` with this small app:

```dart
import 'package:chronoverse/chronoverse.dart';
import 'package:flutter/material.dart';

void main() => runApp(const MyApp());

class MyApp extends StatelessWidget {
  const MyApp({super.key});

  @override
  Widget build(BuildContext context) {
    return MaterialApp(
      theme: ThemeData(colorSchemeSeed: Colors.indigo),
      home: Scaffold(
        appBar: AppBar(title: Text('Leap year? ${Chrono.isLeapYear(2028)}')),
        body: ChronoCalendar(
          onDaySelected: (day) => debugPrint(Chrono.format(day, 'EEEE, d MMMM yyyy')),
        ),
      ),
    );
  }
}
```

Run it on any device:

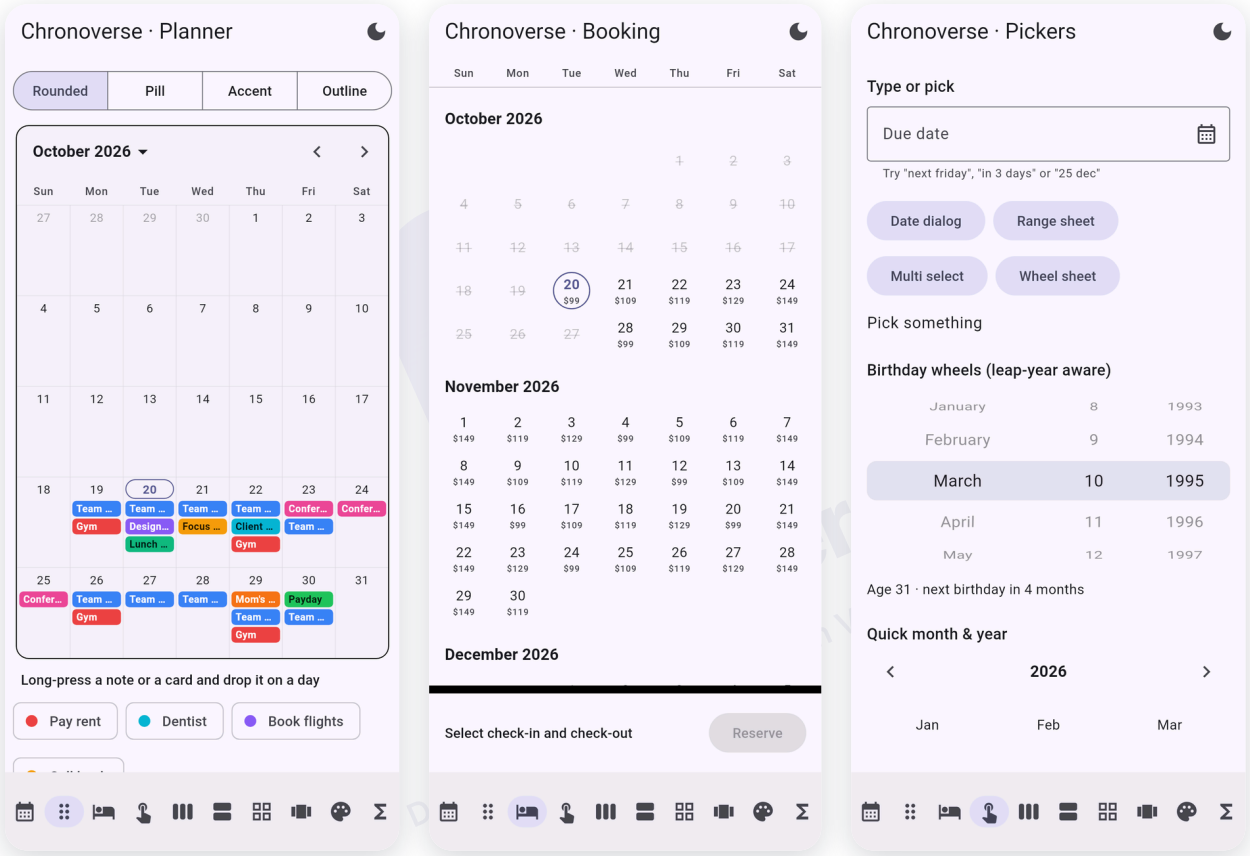

```bash
flutter run            # pick a device when asked
flutter run -d macos   # on a Mac
flutter run -d windows # on a Windows PC
flutter run -d chrome  # in the browser
```

You should see a month calendar under the title *Leap year? true*. Tap a day and its full date is printed in the console. Swipe left or right to change month, and tap the month title to jump to another year.

7 Running the example gallery

The package source includes a gallery app that demonstrates every widget. Download the source from the project repository, then:

```
cd chronoverse/example
flutter pub get
flutter run
```

Planner Booking Pickers

On a wide window the gallery shows a side menu; on a phone it shows a bottom bar. Use the moon icon to switch to dark mode.

8 Platform notes

Platform	Extra setup	Notes
Android	None	No permissions are used.
iOS	None	No Info.plist keys are needed.
Web	None	Works with every web renderer.
macOS	None	No entitlements are needed.
Windows	None	Developer Mode is needed by Flutter itself, not by Chronoverse.
Linux	None	
Pure Dart	None	Import `core.dart`; it does not import Flutter.

Keyboard, mouse and touch

On desktop and web, the arrow keys move between days, Page Up and Page Down change the page, and you can drag pages with the mouse or swipe with a trackpad. On touch devices all gestures work as expected.

9 Updating, pinning and removing

Task	Command
See if a newer version exists	`flutter pub outdated`
Update within your version range	`flutter pub upgrade chronoverse`
Move to the newest major version	`flutter pub upgrade --major-versions chronoverse`
Pin an exact version	`chronoverse: 0.1.0` in pubspec.yaml
Remove the package	`flutter pub remove chronoverse`

> Before updating, read the changelog on the package page. Major versions may contain breaking changes. Always re-test your app, and re-verify any date calculations it depends on.

10 Troubleshooting

Problem	Solution
`flutter` is not recognised	Flutter's `bin` folder is not on your PATH. Repeat step 3 (macOS) or step 3 (Windows), then open a new terminal.
"The current Dart SDK version is ..." / version solving failed	Your SDK is older than required. Run `flutter upgrade`.
"Target of URI doesn't exist: package:chronoverse/..."	Run `flutter pub get` and restart your editor's analysis server.
Windows build fails with a symlink error	Turn on Developer Mode (section 4, step 4).
Calendar shows English though the app is in another language	Pass `locale: ChronoLocale.of('fr')`, or set the app's `locale`; Chronoverse follows it automatically.
Calendar overflows inside a Column	The month view has a natural height. Put it inside a scroll view, or use `sixWeekMonths: true` for a fixed height.
Times look shifted by one hour	Check daylight saving and the time zone of the data. Use `ChronoTimeZone` to convert explicitly.
Hot reload does not pick up a theme change	Do a hot restart; theme extensions are read when the app starts.

If a problem remains, open an issue on the project repository with your Flutter version (`flutter --version`), platform and a small code sample.

11 Disclaimer

Last updated: 20 October 2026

This disclaimer applies to the Chronoverse software package, its source code, example application, documentation, guides, images and any other material distributed with it (together, the **"Software"**). By downloading, installing, copying or using the Software in any way you confirm that you have read, understood and accepted this disclaimer. If you do not accept it, do not use the Software.

1. No guarantee of correct results

The Software performs calculations and conversions involving dates, times, durations, time zones, daylight-saving time, leap years, week numbers, business days, ages, anniversaries, recurrence rules, calendar systems (including Hijri, Persian, Indian National, Buddhist and Julian), moon phases, zodiac signs, holidays, parsing and formatting of text, and similar operations (together, the **"Calculations"**).

The Calculations may be incomplete, inaccurate, out of date or wrong. In particular, but without limitation:

- Time-zone offsets and daylight-saving rules are simplified, are not updated automatically and change by government decision without notice.
- Religious, lunar and regional calendars are computed with arithmetic approximations. Actual dates may differ by one or more days from dates declared by religious or civil authorities, or by local observation.
- Natural-language and typed-date parsing may interpret ambiguous input differently from what the user intended.
- Moon phases, zodiac signs and similar values are approximations for informational and entertainment purposes only.
- Translations, month names, weekday names, plural forms and digit systems may contain errors.
- Results may differ between platforms, devices, operating-system versions and system settings.

2. You must verify every result

You, and every developer, publisher and end user of any application that includes the Software, are solely and fully responsible for independently verifying every result produced by the Software before relying on it. This applies to any use, and especially to use for legal deadlines, contracts, financial or billing periods, payroll, interest, taxation, medical or medication schedules, safety-critical systems, transport and travel bookings, scheduling of appointments or events, religious observance, age verification, compliance, record keeping, or any other purpose where an error could cause loss, harm or inconvenience.

The Software must not be the sole basis for any decision.

3. Provided "as is"

The Software is provided **"AS IS" and "AS AVAILABLE", WITHOUT WARRANTY OF ANY KIND**, express, implied or statutory, including without limitation any warranty of accuracy, reliability, completeness, timeliness, merchantability, fitness for a particular purpose, title, non-infringement, availability, security, compatibility or freedom from errors, defects, viruses or other harmful components. No advice or information, oral or written, obtained from the authors or through the Software creates any warranty.

4. No liability

To the maximum extent permitted by applicable law, **the authors, copyright holders, contributors and maintainers of the Software shall not be liable** for any claim, loss, damage or other liability of any kind, whether direct, indirect,

incidental, special, consequential, exemplary or punitive, including without limitation loss of profits, revenue, data, goodwill, business opportunity, missed deadlines, missed appointments, scheduling conflicts, financial penalties, personal injury or property damage, arising out of or in connection with the Software, its Calculations, its documentation, or the use of or inability to use any of them, whether in contract, tort (including negligence), strict liability or otherwise, even if advised of the possibility of such damage.

Where a jurisdiction does not allow the exclusion or limitation of certain warranties or liabilities, the exclusions and limitations above apply to the fullest extent permitted, and any liability that cannot be excluded is limited to the lowest amount permitted by law.

5. Your applications

If you include the Software in an application, website, library or service, you are solely responsible for that product, for how it uses the Software, for testing it, for the results it shows to your users, and for any notices, terms and disclaimers you give your users. You agree to defend, indemnify and hold harmless the authors and contributors from any claim arising from your product or your use of the Software.

6. Documentation and examples

Documentation, guides, screenshots, code samples and the example application are illustrative only. They may not reflect the latest version and are not a promise of any behaviour, feature or result.

7. Third-party names and data

Any time-zone identifier, calendar name, language name or standard referred to by the Software is used only to describe compatibility. No endorsement by, or affiliation with, any organisation is stated or implied.

8. Changes

This disclaimer may be changed at any time by publishing a new version with the Software. The version included with the copy of the Software you use applies to that copy.

9. Relation to the licence

This disclaimer supplements, and does not replace, the LICENSE. If they conflict, the terms that give the authors and contributors the greater protection apply.
